Methodology

The UT Tyler-Texas Opinion Survey poll was also conducted using a Dynata of registered voters that opt-in to take surveys. The online panel generated a sample of 1,414 registered voters.

The data were weighted to be representative of Texas adults. The weighting balanced sample demographics to population parameters. The sample is balanced to match parameters for gender, age, race/ethnicity, education, and geographic region using an iterated process known as raking. These parameters were derived from 2016 Current Population Survey Voting and Registration Tables, as well as voter registration information from the Texas Secretary of State's Office. The use of these weights in statistical analysis ensures that the characteristics of the sample closely reflect the characteristics of registered voters in Texas.

In this poll, the sampling error for 1414 registered voters in Texas is +/- 2.6 percentage points at a 95 percent confidence interval.
